Gen 4 — End of Major Updates

Vaelon Space is announcing that ResQNet Gen 4 will no longer receive major feature updates beginning this year. This decision reflects our transition to the next generation of the ResQNet platform.

Vaelon Space™ · Software Division 01
Document type: Official lifecycle announcement
Effective: 2026
Applies to: ResQNet Gen 4 (2026–2027 build)
Contact: contact@vaelon.space

1. Summary

Vaelon Space is announcing a change to the ResQNet Gen 4 support lifecycle. From this year forward, **Gen 4 will no longer receive major feature updates**. It remains fully supported for **security fixes**, and it **remains available for purchase**. This is a planned, gradual transition — Gen 4 continues to serve existing and new deployments while the next generation of ResQNet is developed.

This notice does not affect Gen 4 licensing, access tiers, or existing deployments today. It defines how Gen 4 will be serviced going forward.

2. Gen 4 lifecycle status

Major feature updates	Discontinued — as of 2026
Security fixes	Continuing — until Gen 6–7 are released
New license purchases	Available
Existing license support	Uninterrupted
Documentation updates	Frozen at the current release
Commercial-use rights	Unchanged per license terms

Product Lifecycle Notice

3. What "no major updates" means

Gen 4 will stop receiving:

- New features or modules
- Architectural or performance overhauls
- New subsystem integrations
- Additions to the routing, allocation, or simulation engine

Gen 4 will continue to receive:

- Critical security patches and vulnerability fixes
- Compatibility fixes required to keep licensed deployments operational

This follows the same servicing model used for long-lived software platforms: feature freeze, security servicing continues. It is comparable in principle to how Windows 10 was handled — feature development stopped, security updates continued.

Gen 4 will not receive feature parity with Gen 5, and no Gen 4 update should be expected to introduce Gen 5 capabilities.

4. Security support window

Security fixes for Gen 4 will continue **until Gen 6 and Gen 7 are released**.

This means Gen 4 has a defined, extended servicing runway — it is not being retired now, and it is not being abandoned. The support window is anchored to the ResQNet release roadmap rather than a fixed calendar date, so Gen 4 customers have continuity across the Gen 5 transition and beyond.

If a fixed end-of-security-support date is required for procurement or compliance, it will be published ahead of the Gen 6 release.

5. Purchasing Gen 4

Gen 4 remains available for purchase across all current tiers:

- **Non-Licensed** — source access only, no commercial rights
- **Licensed** — full commercial rights, single developer, annual
- **Organization / Government** — contract-based, multi-deployment

Buyers should note that Gen 4 is now a security-serviced product line, not an actively developed one. New purchasers receive the current Gen 4 build, security fixes going forward, and the existing documentation package. New feature development is reserved for Gen 5 and later.

Product Lifecycle Notice

6. Relationship to Gen 5

Gen 5 is in development, targeting **January 2027**. It is the next major generation of ResQNet and will become the actively developed line, extending the same risk-weighted routing and max-flow allocation core validated in Gen 4.

Gen 4 and Gen 5 will **coexist** during the transition. Gen 4 continues to be sold, supported, and serviced for security while Gen 5 is prepared for launch. Gen 4 support will not be interrupted by Gen 5's release.

Details on Gen 5 access, pricing, and migration will be published on the Gen 5 page ahead of launch.

7. Upgrade path

Existing Gen 4 license holders will be offered a defined upgrade path to Gen 5.

We recommend that organizations plan migrations **ahead of the Gen 4 security-support end date** so that no deployment is left running on a line that is no longer serviced. Migration guidance will be published alongside Gen 5's launch details.

8. Summary

- **Gen 4 major updates** — discontinued as of 2026
- **Gen 4 security fixes** — continue until Gen 6-7 are released
- **Gen 4 purchases** — still available
- **Gen 5** — in development, targeting January 2027
- **Servicing model** — feature freeze, security servicing continues
- **Existing deployments** — unaffected today
